

Aditya Aryan is a software engineer working at InnovateX Technologies, a leading AI startup based in Bangalore, India.

He is currently leading a project named NeuroGraph, which aims to build a brain-inspired graph AI system for healthcare analytics.

InnovateX Technologies collaborates with HealthLink, a healthcare provider headquartered in Mumbai.

Together, they have launched initiatives such as Project Lifeline and Project Insight to analyze patient data using advanced AI models.

Neha Sharma is a data scientist who recently joined Project Lifeline under Aditya's mentorship.

She previously worked at Medidata Corp, located in Pune, focusing on clinical trial optimization.

Rahul Mehta, the CTO of InnovateX Technologies, is overseeing the strategic direction of NeuroGraph and has partnered with Stanford AI Lab for research collaboration.

In 2024, Project Insight achieved a milestone by processing over 10 million anonymized patient records to detect early signs of chronic diseases using graph neural networks.

The project was supported by the Indian Institute of Science (IISc), Bangalore, and funded by the Ministry of Health and Family Welfare, Government of India.

Dr. Priya Verma from IISc played a key role in developing the anomaly detection algorithm used in Project Insight.

She worked closely with Neha Sharma and the engineering team at InnovateX to fine-tune the model's precision.

Meanwhile, HealthLink has deployed the model across its network of 150+ hospitals in Western India, resulting in a 25% improvement in diagnostic accuracy.

They are now planning a pilot program in collaboration with the UK's National Health Service (NHS) for cross-border AI-powered diagnostics.

Another significant contributor is Arjun Das, a full-stack developer from VIT Chennai, who joined the InnovateX team as part of a summer internship program.

He contributed to building the data ingestion pipeline using FastAPI, Apache Kafka, and Neo4j to power real-time insights for NeuroGraph.

In recognition of their work, the Project Lifeline team was invited to present at the Global HealthTech Summit 2025 in Geneva.

Their talk focused on Using Graph AI for Preventive Healthcare in Emerging Economies.

Furthermore, InnovateX is launching a new initiative in Q4 2025 named Project VitalNet, aimed at rural health infrastructure mapping using satellite data and citizen-reported symptoms.

This project will involve collaboration with ISRO and local public health departments.

The long-term vision of InnovateX is to build an open health knowledge graph that aggregates public health records, environmental data, and genetic information to aid global health researchers.
